## Lecture 3 <br> Stoichiometry

University Chemistry

## Molar mass and the mole

- one mole is defined as the number of carbon atoms in exactly 12.000000 grams of pure ${ }^{12} \mathrm{C}$.
- A mole of sugar $\left(\mathrm{C}_{12} \mathrm{H}_{22} \mathrm{O}_{11}\right.$ would have a mass of 342.299 grams.
- This quantity is known as the molar mass, a term that is often used in place of the terms atomic mass or
 molecular mass.

Determine the molar mass of NaOH ?
NaOH contains one Na atom + one oxygen atom + one hydrogen atom Molar mass $=1 \mathrm{x}$ mass of Na atom +1 x mass of O atom +1 x mass of H atom
The masses of the elements can be obtained from the periodic table.

$$
\begin{aligned}
& \quad=1 \times 22.99+1 \times 16.00+1 \times 1.008=39.99 \mathrm{~g} \\
& \text { Molar mass of } \mathbf{N a O H}=\mathbf{3 9 . 9 9} \mathbf{g}
\end{aligned}
$$

## Number of moles

- To determine the number of moles use the following formula or triangles:

$$
\text { number of moles }=\frac{\operatorname{mass}(g)}{\text { molar mass }(g / \operatorname{mole})}
$$

How many moles are there in 22.99 g of sodium?
number of moles $=\frac{\operatorname{mass}(\mathrm{g})}{\text { molar mass }(\mathrm{g} / \mathrm{mole})}=\frac{22.99 \mathrm{~g}}{22.99 \mathrm{~g} / \mathrm{mole}(\text { from the periodic table })}$
number of moles $=1$ mole .
How many moles are there in 1 g of chlorine?
number of moles $=\frac{\operatorname{mass}(\mathrm{g})}{\operatorname{molar} \operatorname{mass}(\mathrm{g} / \text { mole })}=\frac{1 \mathrm{~g}}{35.45 \mathrm{~g} / \mathrm{mole}(\text { from the periodic table })}$
number of moles $=0.028$ mole .

## How many grams are there in 0.10 mole of $\mathrm{CH}_{4}$ ?

First calculate the molar mass of $\mathrm{CH}_{4}$ Molar mass of $\mathrm{CH}_{4}=1 \times$ mass of C atom +4 x mass of H atoms

$$
=1 \times 12.01+4 \times 1.008=16.02 \mathrm{~g} / \mathrm{mole}
$$

Then use the formula:

$$
\text { mass of } \begin{aligned}
\mathrm{CH}_{4} & =\text { number of moles } \times \text { molar mass of } \mathrm{CH}_{4} \\
& =0.10 \text { mole } \times 16.02 \mathrm{~g} / \text { mole }=1.602 \mathrm{~g}
\end{aligned}
$$

Which one is the lightest in mass: one mole of hydrogen, one mole of sodium, one mole of iron, one mole of sulfur?

One mole for an element contains the atomic mass of the element. Atomic mass of $\mathrm{H}=1.008 \mathrm{~g} /$ mole, Atomic mass of $\mathrm{Na}=22.99 \mathrm{~g} /$ mole, Atomic mass of $\mathrm{Fe}=55.85 \mathrm{~g} /$ mole, Atomic mass of $\mathrm{S}=32.07 \mathrm{~g} / \mathrm{mole}$.

The lightest one is one mole of hydrogen The heaviest one mole is the iron.

## - Avogadro's number and the mole

1 mole of anything contains the Avogadro 's Number $\left(\mathrm{N}_{\mathrm{A}}\right)$ of this thing

$$
\text { Avogadro 's Number }(N A)=6.02214 \times 10^{23}
$$

1 mole of particles= $6.02214 \times 1023$ particles for any substance

1 mole of shoes= $6.02214 \times 1023$ shoes

1 mole of cars = $6.02214 \times 1023$ car

1 mole of carbon atoms= $6.02214 \times 1023$ carbon atoms

1 mole of water molecules = $6.02214 \times 1023$ water molecules

To calculate the number of particles (atoms, molecules, shoes....etc) use the following formula:

Number of particles $=$ number of moles $\mathbf{x}$ Avogadro's number
Calculate the number of atoms in 2 mole of hydrogen? Number of hydrogen atoms =

2 moles of $\mathrm{H} \times 6.02214 \times 10^{23} \mathrm{H}$ atom / mole Number of hydrogen atoms $=1.20 \times 10^{24} \mathrm{H}$ atom

Calculate the number of atoms in 6.46 grams of helium $(\mathrm{He})$ ?
number of moles $=\frac{\operatorname{mass}(\mathrm{g})}{\operatorname{molar} \operatorname{mass}(\mathrm{g} / \text { mole })}=\frac{6.46 \mathrm{~g}}{4.003 \mathrm{~g} / \text { mole }(\text { from the periodic table })}$
number of moles $=1.61$ mole.

Number of He atoms $=$ number of moles $\times$ Avogadro's number $=1.61$ moles of $\mathrm{He} \times 6.02214 \times 10^{23} \mathrm{He}$ atom $/$ mole $=9.66 \times 10^{23} \mathrm{He}$ atom

Caffeine is a stimulant drug and it is found in coffee, tea and beans. Its molecular formula is $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{2}$. Calculate the ${ }^{0}$ number of oxygen atoms in 19.40 grams of caffeine.
Molar mass of caffeine $=8 \times \mathrm{C}+10 \times \mathrm{H}+4 \times \mathrm{N}+2 \times \mathrm{O}$
$=8 \times 12+10 \times 1+4 \times 14+2 \times 16=194 \mathrm{~g} / \mathrm{mole}$
number of moles $=\frac{\operatorname{mass}(\mathrm{g})}{\operatorname{molar} \operatorname{mass}(\mathrm{g} / \mathrm{mole})}=\frac{19.40 \mathrm{~g}}{194 \mathrm{~g} / \mathrm{mole}(\text { from the periodic table })}$
number of moles $\mathbf{= 0 . 1 0}$ mole
Total number of $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{2}$ molecules= number of moles $\times \mathrm{N}_{\mathrm{A}}$
 $=0.10$ moles $\times 6.022 \times 10^{23}$ molecules $/$ mole
Total number of $\mathrm{C}_{8} \mathrm{H}_{10} \mathrm{~N}_{4} \mathrm{O}_{2}$ molecules $=6.022 \times 10^{22}$ molecules

Number of oxygen atoms $=\frac{\text { number of oxygen atoms }}{\text { molecules }} x$ total number of molecules

$$
\text { Number of oxygen atoms }=\frac{2 \text { oxygen atoms }}{\text { molecules }} \times 6.022 \times 10^{22} \text { molecules }
$$

Number of oxygen atoms $=1.20 \times 10^{23}$ oxygen atoms

$$
\begin{aligned}
& \text { Number of carbon atoms }=4.8 \times 10^{23} \text { carbon atoms } \\
& \text { Number of hydrogen atoms }=6.022 \times 10^{23} \text { hydrogen atoms } \\
& \text { Number of nitrogen atoms }=2.40 \times 10^{23} \text { nitrogen atoms }
\end{aligned}
$$

## Mass Percent

The Mass Percent of an element is defined as:

$$
\text { Mass Percent of an element }=\frac{\text { Mass of the element }}{\text { Total molar mass of the sample }} \times 100 \%
$$

What is the mass percent of carbon, hydrogen, and oxygen in pure ethanol $\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{O}$ ?
-First: calculate the molar mass of $\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{O}$
MW of $\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{O}=2 \times \mathrm{C}+6 \times \mathrm{H}+1 \times \mathrm{O}$

$$
=2 \times 12.01+6 \times 1.008+1 \times 16.00
$$

MW C $\mathrm{C}_{2} \mathrm{H}_{6} \mathrm{O}=46.07 \mathrm{~g} / \mathrm{mole}$
-Second: calculate the mass percents

$$
\begin{aligned}
& \text { Mass } \% \mathrm{C}=100 \times\left(\frac{\text { mass of C }}{\text { total molar mass }}\right)=100 \times\left(\frac{2 \times 12.01}{46.07}\right)=52.14 \% \\
& \text { Mass } \% \mathrm{H}=100 \times\left(\frac{\text { mass of H }}{\text { total molar mass }}\right)=100 \times\left(\frac{6 \times 1.008}{46.07}\right)=13.13 \% \\
& \text { Mass } \% \mathrm{O}=100 \times\left(\frac{\text { mass of O }}{\text { total molar mass }}\right)=100 \times\left(\frac{1 \times 16.00}{46.07}\right)=34.72 \% \\
& \text { Note that the mass percentages should add up to } 100 \% . \\
& \text { Mass \% }
\end{aligned} \begin{aligned}
& =\text { Mass } \% \mathrm{C}+\text { Mass } \% \mathrm{H}+\text { Mass \% O } \\
& =52.14 \%+13.13 \%+34.72 \%=99.99 \%
\end{aligned}
$$

## Combustion Analysis

- It is used to determine the mass \% for different elements in the compound.

The sample is burned in the presence of excess oxygen which converts all the carbon to carbon dioxide and all the hydrogen to water.
The $\mathrm{CO}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$ produced are absorbed in two different stages and their masses determined by measuring the increase in weight ${ }_{9}$ of the absorbers.

## Empirical Formulas (simplest formula)

- It shows the simplest whole number ratio of atoms in a molecule.
- For example, hydrogen peroxide's chemical formula is $\mathrm{H}_{2} \mathrm{O}_{2}$, but its empirical formula is HO

Molecular Formula $=\left(\frac{\text { Molecular weight of unknown }(\mathrm{g} / \mathrm{mole})}{\text { mass of Emperical formula }}\right) \mathbf{x E m p e r i c a l}$ formula
Write the different formulas for the glucose molecule The chemical formula for glucose is $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$, but its empirical formula is $\mathrm{CH}_{2} \mathbf{O}$, and its structural formula is

- Ascorbic acid (vitamin C) contains only C, H, and O.. Combustion of 1.000 g of Ascorbic acid produced 40.9\% C and 4.5\% H. What is the empirical formula for Ascorbic Acid?
First: calculate the mass percent of Oxygen.
Since the sample contains $\mathrm{C}, \mathrm{H}$, and O , then the remaining $100 \%-40.9 \%-4.5 \%=54.6 \%$ is Oxygen

Second: Suppose 100 g of this substance

| Steps |  | $\mathbf{C}$ | $\mathbf{H}$ | $\mathbf{O}$ |
| :--- | :--- | :---: | :---: | :---: |
| $\mathbf{1}$ | Mass $/ \mathrm{g}$ | 40.9 | 4.5 | 54.6 |
| $\mathbf{2}$ | No. of moles $=\frac{\text { mass }}{\text { molar mass }}$ | $\frac{40.9}{12}=3.4$ | $\frac{4.5}{1}=4.5$ | $\frac{54.6}{16}=3.4$ |
| $\mathbf{3}$ | $\div$ smallest number (3.4) | 1 | 1.3 | 1 |
| $\mathbf{4}$ | x by a number to make step 3 <br> integer numbers $(\mathrm{x} 3)$ | $1 \times 3=3$ | $1.3 \times 3=4$ | $1 \times 3=3$ |
| $\mathbf{5}$ | Empirical formula $\mathrm{C}_{3} \mathrm{H}_{4} \mathrm{O}_{3}$ | 3 C | 4 H | 3 O |

What is the molecular formula if the molecular mass of Ascorbic Acid was founded to be 176 $\mathrm{g} / \mathrm{mole}$ ?

Molecular Formula $=\left(\frac{\text { Molecular weight of unknown }(\mathrm{g} / \mathrm{mole})}{\text { mass of emperical formula }}\right) \times$ empirical Formula

$$
\begin{aligned}
\text { Molecular Formula } & =\left(\frac{176(\mathrm{~g} / \text { mole })}{3 \times 12+4 \times 1+3 \times 16}\right) \times \mathrm{C}_{3} \mathrm{H}_{4} \mathrm{O}_{3}= \\
& =2 \times \mathrm{C}_{3} \mathrm{H}_{4} \mathrm{O}_{3}=\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{O}_{6}
\end{aligned}
$$

## Chemical Reactions

It is process in which one or more pure substances are converted into one or more different pure substance.
All chemical reactions involve a change in substances and a change in energy.
Neither matter nor energy is created or destroyed in a chemical reaction, only changed.

## Chemical equation

- When a chemical reaction occurs, it can be described by an equation.
- This shows the chemicals that react (reactants) on the left-hand side, and the chemicals that they produce (products) on the righthand side.

Reactants Reaction conditions $\xrightarrow{\text { Products }}$
Reaction between hydrogen gas and oxygen gas to produce liquid water

$$
\begin{aligned}
\text { hydrogen gas + oxygen gas } & \longrightarrow \mathrm{O}_{2}(g) \longrightarrow 2 \mathrm{H}_{2} \mathrm{O}(\Omega)
\end{aligned}
$$

## Balancing chemical equations

- first write the correct formula for both reactants and products and then balance all of the atoms on the left side of the reaction with the atoms on the right side.
Write the chemical equation which represents the burning of glucose in presence of oxygen gas which produces carbon dioxide and water.

To answer this question, follow the following steps:

1. Identify the reactants and the products and put an arrow in between.

$$
\text { glucose + oxygen gas } \longrightarrow \quad \text { carbon dioxide }+ \text { water }
$$

2. Try to figure out the correct formula for the reactants and products, Glucose is $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$, oxygen gas is $\mathrm{O}_{2}$, carbon dioxide is $\mathrm{CO}_{2}$, and water is $\mathrm{H}_{2} \mathrm{O}$.

$$
\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+\mathrm{O}_{2} \longrightarrow \mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}
$$

3.Count the number of each atom at both sides of the equation:

$$
\begin{aligned}
& \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+\mathrm{O}_{2} \longrightarrow \mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O} \\
& (6 \mathrm{C}+12 \mathrm{H}+6 \mathrm{O})+\quad(2 \mathrm{O}) \longrightarrow(1 \mathrm{C}+2 \mathrm{O})+(2 \mathrm{H}+1 \mathrm{O}) \\
& \text { Total: } \quad(6 \mathrm{C}+12 \mathrm{H}+8 \mathrm{O}) \longrightarrow(1 \mathrm{C}+2 \mathrm{H}+3 \mathrm{O})
\end{aligned}
$$

## Balance C first, then H, and finally O:

At the left side there are 6 C atoms and at the right side there are 1 C atom, so multiply $\mathrm{CO}_{2}$ by 6 (x 6)

$$
\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+\mathrm{O}_{2} \longrightarrow 6 \mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}
$$

At the left side there are 12 H atoms and at the right side there are 2 H atom, So multiply $\mathrm{H}_{2} \mathrm{O}$ by 6 (x 6)

$$
\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+\mathrm{O}_{2} \longrightarrow 6 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O}
$$

At the left side there are 8 O atoms and at the right side there are 18 O atom, So multiply $\mathrm{O}_{2}$ by 6 (x 6)

$$
\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+6 \mathrm{O}_{2} \longrightarrow 6 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O}
$$

Recount all atoms again,

$$
\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+6 \mathrm{O}_{2} \longrightarrow 6 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O}
$$

$$
(6 \mathrm{C}+12 \mathrm{H}+6 \mathrm{O})+(12 \mathrm{O}) \quad(6 \mathrm{C}+12 \mathrm{O})+(12 \mathrm{H}+6 \mathrm{O})
$$

$$
\text { Total: (6 C + } 12 \mathrm{H}+18 \mathrm{O})
$$

$$
(6 \mathrm{C}+12 \mathrm{H}+18 \mathrm{O})
$$

## Amount of reactants and products problems

$$
\mathrm{aA} \longrightarrow \mathrm{bB}
$$

In this type of problems, you are given the mass (\#moles) of the reactant and you calculate the mass (\#moles) of the product.
You can use the following formula to calculate the \#moles of B:

$$
\text { number of moles of }(B)=\text { number of } \operatorname{moles} o f(A) \times\left(\frac{b}{a}\right)
$$

You can use the following formula to calculate the mass of B :

$$
\text { mass of }(B)=\left(\frac{\operatorname{mass} \text { of }(A)}{\operatorname{Molar} \operatorname{mass} \text { of }(A)}\right) \times\left(\frac{b}{a}\right) \times \operatorname{Molar} \text { mass of }(B)
$$

How many grams of water are produced when 7.00 grams of oxygen react with an excess of hydrogen according to the reaction shown below?

$$
2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g})--->2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g})
$$

$\checkmark$ The "excess" reactant has nothing to do with the problem. $\checkmark$ Identify which is the "given" and which is the unknown.

$$
\begin{array}{rc}
2 \mathrm{H}_{2}(\mathrm{~g})+\mathrm{O}_{2}(\mathrm{~g}) & ---> \\
10 \mathrm{~g} & 2 \mathrm{H}_{2} \mathrm{O}(\mathrm{~g}) \\
?
\end{array}
$$

- Use the formula:

$$
\begin{gathered}
\text { mass of }\left(\mathrm{H}_{2} \mathrm{O}\right)=\left(\frac{\text { mass of } \mathrm{O}_{2}}{\text { Molarmass of } \mathrm{O}_{2}}\right) \times\left(\frac{2\left(\mathrm{H}_{2} \mathrm{O}\right)}{1\left(\mathrm{O}_{2}\right)}\right) \times \operatorname{Molarmassof}\left(\mathrm{H}_{2} \mathrm{O}\right) \\
\operatorname{mass} \text { of }\left(\mathrm{H}_{2} \mathrm{O}\right)=\left(\frac{7.0 \mathrm{~g}}{32 \mathrm{~g} / \text { mole }}\right) \times\left(\frac{2\left(\mathrm{H}_{2} \mathrm{O}\right)}{1\left(\mathrm{O}_{2}\right)}\right) \times 18 \mathrm{~g} / \text { mole }
\end{gathered}
$$

Mass of $\mathrm{H}_{2} \mathrm{O}=7.89 \mathrm{~g}$
Calculate the number of moles of $\mathrm{CO}_{2}$ resulted from the reaction of 3.5 moles of $\mathrm{C}_{2} \mathrm{H}_{6}$ with excess oxygen according to the equation

$$
2 \mathrm{C}_{2} \mathrm{H}_{6}+7 \mathrm{O}_{2} \rightarrow 4 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O}
$$

-Use the formula:

$$
\begin{aligned}
& \text { number of moles of }\left(\mathrm{CO}_{2}\right)=\text { number of moles of }\left(\mathrm{C}_{2} \mathrm{H}_{6}\right) \times\left(\frac{4\left(\mathrm{C}_{2} \mathrm{H}_{6}\right)}{2\left(\mathrm{CO}_{2}\right)}\right) \\
& \text { number of moles of }\left(\mathrm{CO}_{2}\right)=3.5 \text { moles of }\left(\mathrm{C}_{2} \mathrm{H}_{6}\right) \times\left(\frac{4\left(\mathrm{C}_{2} \mathrm{H}_{6}\right)}{2\left(\mathrm{CO}_{2}\right)}\right)
\end{aligned}
$$

Number of moles of $\mathrm{CO}_{2}=7.0$ moles

Calculate the mass of chlorine that reacts with 4.770 g of hydrogen to form hydrogen chloride according the following equation:
-Use the formula:

$$
\mathrm{H}_{2}+\mathrm{Cl}_{2} \rightarrow 2 \mathrm{HCl}
$$

$$
\begin{gathered}
\operatorname{mass} \text { of }\left(\mathrm{Cl}_{2}\right)=\left(\frac{\operatorname{mass} \text { of } \mathrm{H}_{2}}{\operatorname{Molar} \text { mass of } \mathrm{H}_{2}}\right) \times\left(\frac{1\left(\mathrm{H}_{2}\right)}{1\left(\mathrm{Cl}_{2}\right)}\right) \times \operatorname{Molar} \text { mass of }\left(\mathrm{Cl}_{2}\right) \\
\operatorname{mass} \text { of }\left(\mathrm{Cl}_{2}\right)=\left(\frac{4.770 \mathrm{~g} \text { of } \mathrm{H}_{2}}{2.0 \mathrm{~g} / \text { mole }}\right) \times\left(\frac{1\left(\mathrm{H}_{2}\right)}{1\left(\mathrm{Cl}_{2}\right)}\right) \times 71.0 \mathrm{~g} / \mathrm{mole}
\end{gathered}
$$

Mass of $\mathrm{Cl}_{2}=169.3 \mathrm{~g}$

## Limiting Reagents

$$
\mathrm{aA}+\mathrm{bB} \longrightarrow \mathrm{dD}
$$

When two substances $A$ and $B$ are present in random quantities and react with each other to produce $D$, the first consumed one is the limiting reagent and the second one is remained in excess.

To determine the limiting reagent from given moles of substance, do the followings:
1- Calculate the ratio for each reagent, by dividing the given moles of a reagent to its factor in the chemical equation.

2- Compare the ratios for the reagents and the limiting reagent is the smallest one.

If 5 moles of NO were mixed with 5 moles of $\mathrm{O}_{2}$ to react as: $\quad \mathbf{2 N O}(\mathrm{g})+\mathrm{O}_{2}(\mathrm{~g}) \rightarrow \mathbf{2} \mathrm{NO}_{2}(\mathrm{~g})$
Determine the limiting reagent.
The ratio of $\mathrm{NO}=\frac{\mathbf{5 m o l}(\text { given })}{2 \mathrm{~mol} \text { (factor })}=2.5$
The ratio of $\quad \mathrm{O}_{2}=\frac{5 \mathrm{~mol}}{1 \mathrm{~mol}}=5$
The limiting reactant is NO because it is the smallest
If 400 g Fe were mixed with $300 \mathrm{~g} \mathrm{O}_{2}$ to react as:

Step 1: Change the mass in gramsinto moles for the given substances

$$
400 \mathrm{gFe} \times \frac{1 \mathrm{molFe}}{55.8 \mathrm{~g} / \mathrm{mole} \mathrm{Fe}}=7.17 \mathrm{~mol} \mathrm{Fe} \quad 300 \mathrm{~g} \mathrm{O}_{2} \times \frac{1 \mathrm{~mole} \mathrm{O}_{2}}{32 \mathrm{~g} / \mathrm{moleO}_{2}}=9.38 \mathrm{~mol} \mathrm{O}_{2}
$$

Step2: Calçulate the ratio and compare

$$
\mathrm{Fe}=\frac{7.17 \mathrm{~mol}}{4 \mathrm{~mol}}=1.793 \quad \mathrm{O}_{2}=\frac{9.38 \mathrm{~mol}}{3 \mathrm{~mol}}=3.127 \quad \text { Fe is the limiting reactant }
$$

## Chemical reaction yield

- For any chemical reaction there are theoretical and actual (practical) yield.
- Theoretical yield (T.Y.) is the amount of product that would result if all the limiting reactant reacted.
- Actual yield (A.Y.) is the amount of product actually obtained from a reaction.
- Due to many factors can affected on the reaction, A.Y. is always less than T.Y.
- Percent yield is the efficient for a given reaction:

$$
\% \text { yield }=\frac{\mathrm{A} . \mathrm{Y}}{\mathrm{~T} . \mathrm{Y} .} \times 100
$$

Many tons of urea $\left(\mathrm{CO}\left(\mathrm{NH}_{2}\right)_{2}\right)$ are produced every year in fertilizerinsiniven chasty industries. When 119 g ammonia react with 80 g CO 2 as the
equation: $2 \mathrm{NH}_{3}(\mathrm{~g})+\mathrm{CO}_{2}(\mathrm{~g}) \rightarrow \mathbf{C O}\left(\mathrm{NH}_{2}\right)_{2}(\mathrm{~s})+\mathrm{H}_{2} \mathrm{O}$
and produce 100 g urea, calculate $\%$ yield?

- Step 1: Determine the limiting reagent
- Change the mass in grams into moles for the given substances

$$
119 \mathrm{~g} \mathrm{NH}_{3} \times \frac{1 \mathrm{~mole} \mathrm{NH}_{3}}{17 \mathrm{~g} \mathrm{NH}_{3}}=7 \mathrm{~mol} \mathrm{NH}_{3} \quad 80 \mathrm{~g} \mathrm{CO}_{2} \times \frac{1 \mathrm{~mole} \mathrm{CO}_{2}}{44 \mathrm{~g} \mathrm{CO}_{2}}=1.82 \mathrm{~mol} \mathrm{CO}_{2}
$$

- Calculate the ratio and compare
$\mathrm{NH}_{3}=\frac{7 \mathrm{~mol}}{2 \mathrm{~mol}}=3.5 \quad \mathrm{CO}_{2}=\frac{1.82 \mathrm{~mol}}{1 \mathrm{~mol}}=1.82 \quad \mathrm{CO}_{2}$ is the limiting reagent
Now, ignore $\mathrm{NH}_{3}$ and compare between $\mathrm{CO}_{2}$ and $\mathrm{CO}\left(\mathrm{NH}_{2}\right)_{2}$ only.
- Step 2: Calculate the Theoretical Yield [\#moles of $\mathrm{CO}\left(\mathrm{NH}_{2}\right)_{2}$ ]

$$
\text { number of moles of }(B)=\text { number of moles of }(A) x\left(\frac{b}{a}\right)
$$

$$
\# \text { moles } \mathrm{CO}\left(\mathrm{NH}_{2}\right)_{2}=\# \text { moles ofCO }{ }_{2} \times\left(\frac{1}{1}\right)=1.82 \mathrm{molesCO}_{2} \times 1
$$

Number of moles of $\mathrm{CO}\left(\mathrm{NH}_{2}\right)_{2}=1.82$ moles

## Step 3: Calculate the Theoretical Yield [mass of $\mathrm{CO}\left(\mathrm{NH}_{2}\right)_{2}$ ]

 produces:The T.Y. $=1.82$ mole urea $\times \frac{60 \mathrm{~g} \text { urea }}{1 \mathrm{~mole} \text { urea }}=109 \mathrm{~g}$ urea

Step 4: Calculate the \%Yield of $\mathrm{CO}\left(\mathrm{NH}_{2}\right)_{2}$ :

$$
\begin{gathered}
\% \text { yield }=\frac{\text { A.Y. }}{\text { T.Y. }} \times 100 \\
\% \text { yield }=\frac{100}{109} \times 100=91.7 \%
\end{gathered}
$$

## Solutions and concentration

- A solution is a homogeneous mixture of 2 or more substances (gas, liquid, or solid) in a single phase and it contains a solute (the substance that is dissolved in a solvent) and a solvent (a liquid in which a substance is dissolved).
- When the solvent is water, the solution is said to be aqueous (aq).

Concentration of solution can be expressed in different wavs:
$\operatorname{Molarity}(\mathbf{M})=\frac{\text { moles of solute }}{\text { volume of solution (liter) }}$

$$
\text { Weight } \%=\frac{\text { weight of solute }}{\text { weight of solution }} \times 100
$$

Calculate the mass required to prepare a 250 mL 0.01 M solution of $\mathrm{KMnO}_{4}$ ?
Convert 250 ml to $\mathrm{L}(250 / 1000=0.250 \mathrm{~L})$ Using the formula:
\# moles $=$ molarity $x$ volume $=0.01 \mathrm{~mol} / \mathrm{L} \times 0.250 \mathrm{~L}$ $=0.0025 \mathrm{~mol}$
Mass = \# moles x molar mass

Molar mass of $\mathrm{KMnO4}=158.0 \mathrm{~g} / \mathrm{mole}$ Mass of $\mathrm{KMnO}_{4}$ needed $=0.0025 \mathrm{~mol} \times 158.0 \mathrm{~g} / \mathrm{mole}$ $=0.395 \mathrm{~g}$ of $\mathrm{KMnO}_{4}$
So, weigh 0.395 g of $\mathrm{KMnO}_{4}$ and dissolve them in 250 ml volumetric flask.

If a solution contains 0.035 moles solute in 2.0 L of water, what is the molarity?
Molarity ( M ) = moles of solute $/$ volume of solution (liter)

$$
=0.035 \text { moles } / 2.0 \mathrm{~L}=1.8 \times 10^{-2} \mathrm{M}
$$

## Dilution of concentrated solutions

\# fish = 5
Volume = 1 L
Concentration = 5 fishes $/ 1 \mathrm{~L}$

\# fish = 5
Volume = 2 L
Concentration = 5 fishes/2 L

- If you have 5 fishes in a 1 L tank and you moved them in another 2 L tank, what will happened?
- The number of the fishes remain the same ( 5 fishes), but their concentrations changes.
- The fishes are the moles, when you put same number of moles in different volumes, the number of moles stay the same, but the concentrations changed.

## Dilution of concentrated solutions

- When we dilute a solution by mixing it with more solvent, the amount of solute present does not change, but the total volume and the concentration of the solution do change.
- To calculate the molarity after dilution, we can use the following formula:

$(\text { Molarity } \mathbf{x} \text { Volume })_{\text {before dilution }}=(\text { Molarity } \mathbf{x} \text { Volume })_{\text {after dilutio }}$

$$
M_{1} \times V_{1}=M_{2} \times V_{2}
$$

How many milliliters of $18.0 \mathrm{M} \mathrm{H}_{2} \mathrm{SO}_{4}$ are required to prepare 1.00 L of a 0.900 M solution of $\mathrm{H}_{2} \mathrm{SO}_{4}$ ?
Using the formula: $M_{1} \times V_{1}=M_{2} \times V_{2}$
$\mathrm{M}_{1}=18.0 \mathrm{M}, \mathrm{V}_{1}=$ ?? $\quad$ And $\mathrm{M}_{2}=0.900 \mathrm{M}, \mathrm{V}_{2}=1.00 \mathrm{~L}$
So,

$$
\mathrm{V}_{1}=\frac{\mathrm{M}_{2} \times \mathrm{V}_{2}}{\mathrm{M}_{1}}=\frac{0.900 \mathrm{M} \times 1.00 \mathrm{~L}}{18.0 \mathrm{M}}=0.0500 \mathrm{~L}=50.0 \mathrm{~mL}
$$

What volume of 1.5 M HCl is required to react with 34.6 mL of 2.44 M NaOH ?

$$
\mathrm{NaOH}_{(\mathrm{aq})}+\mathrm{HCl}_{(\mathrm{ag})} \rightarrow \mathrm{NaCl}_{(\mathrm{aq})}+{\mathrm{H} 2 \mathrm{O}_{(\mathrm{l})}}
$$

First calculate the number of moles of NaOH :
2.44 M X (34.6/1000)L = 0.0844 mole NaOH

From the chemical equation:
$\mathrm{NaOH}_{(\mathrm{aq)}}+\mathrm{HCl}_{(\mathrm{ag})} \rightarrow \mathrm{NaCl}_{(\mathrm{aq)}}+{\mathrm{H} 2 \mathrm{O}_{(\mathrm{l})}}$
One mole of HCl reacts with one mole of NaOH 0.0844 mole HCl reacts with 0.0844 mole NaOH

Number of moles of $\mathrm{HCl}=$ molarity of HCl X volume of solution
0.0844 moles $\mathrm{HCl}=1.5 \mathrm{M} \mathrm{X} \mathrm{V}$

The volume of $\mathrm{HCl}=0.056 \mathrm{~L}=56 \mathrm{~mL}$

According to the reaction:

## $\mathrm{Ba}(\mathrm{OH})_{2(\mathrm{aq})}+2 \mathrm{HNO}_{3(\mathrm{aq})} \rightarrow \mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2(\mathrm{aq})}+2 \mathrm{H}_{2} \mathrm{O}_{\text {(I) }}$

What volume of $0.5 \mathrm{M} \mathrm{HNO}_{3}$ is required to react with 41.77 mL of $0.1603 \mathrm{M} \mathrm{Ba}(\mathrm{OH})_{2}$ ?

From the chemical equation:

$$
\mathrm{Ba}(\mathrm{OH})_{2(\mathrm{aq})}+2 \mathrm{HNO}_{3(\mathrm{aq})} \rightarrow \mathrm{Ba}\left(\mathrm{NO}_{3}\right)_{2(\mathrm{aq})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{I})}
$$

2 Moles of $\mathrm{HNO}_{3}$ react with one mole of $\mathrm{Ba}(\mathrm{OH})_{2}$
\# moles of $\mathrm{Ba}(\mathrm{OH})_{2}=$ molarity X volume of solution

$$
=0.1603 \mathrm{M} \mathrm{X}(41.77 / 1000) \mathrm{L}=6.696 \times 10^{-3} \mathrm{~mol}
$$

The moles of $\mathrm{HNO}_{3}$ which reacted $=2 \times 6.696 \times 10^{-3}=13.39 \times 10^{-3} \mathrm{~mol}$

$$
\begin{aligned}
& \# \text { moles of } \mathrm{HNO}_{3}=\text { molarity } \mathrm{X} \text { volume of solution } \\
& 13.39 \times 10^{-3} \mathrm{~mol}^{2}=0.5 \mathrm{M} \mathrm{X} \mathrm{~V} \\
& \mathrm{~V}=0.0417 \mathrm{~L}=41.7 \mathrm{~mL}
\end{aligned}
$$
